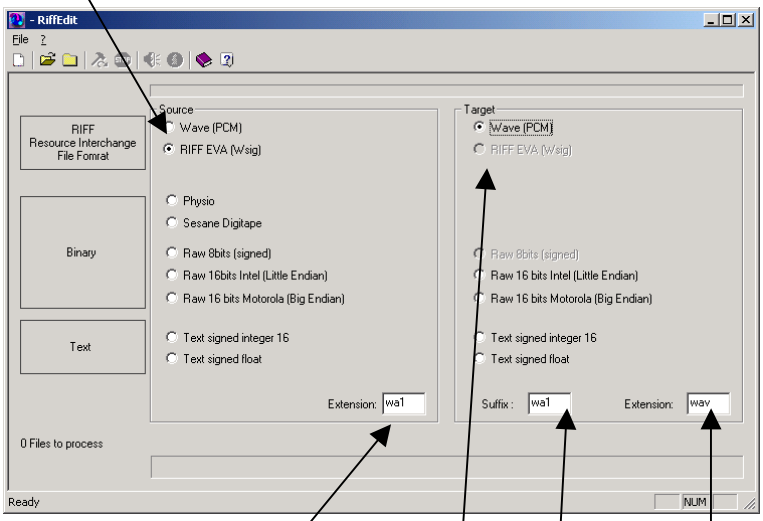
1. Select source format



2. Change the source file extension if necessary
3. Select target format
4. Change the target file suffix if necessary

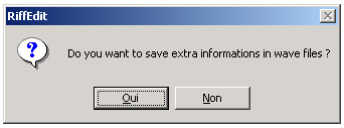
Rem : the suffix will be added at the end of the file name
ex:
GOAM0001.oaf converted in text (*.txt) with suffix “oaf”
will be converted in GOAM0001oaf.txt
GOAM0001.naf converted in text (*.txt) with suffix “naf”
will be converted in GOAM0001naf.txt

5. Change the target file extension if necessary

6. You can convert :
   - A single file (cf. Single File Conversion)
   - All the files contained in a folder (cf. Loop Conversion)
     In such a case, all the files matching with the source extension will be processed.

Conversion in Wave File is **Std Windows PCM.**

A prompt will ask you if you want to add Extra Information.



If positive answer, information chunks* as `ICRD (creation date), ICMT (comment)` will be added in the converted Wave File. This information is written by following RIFF standard. So, normally, all software RIFF-compatible should accept such information without problem. If you encounter problems when reading converted wave files with extra information, convert again the files without extra information.

* The basic building block of a Resource Interchange File Format (RIFF) file, consisting of an identifier (called a chunk identifier), a chunk-size variable, and a chunk data area of variable size.
